

# Help patients like Baby PJ!

Presley Jordan is a 4 month old baby girl who is recovering from pneumonia. During her 52 day hospitalization at Banner Thunderbird and Phoenix Children's Hospital, she underwent almost 100 tests to diagnose an underlying condition. On June 30<sup>th</sup> she received an O negative blood transfusion to strengthen her body and remove ventilator support for breathing. No diagnosis as of yet, so she will continue to need tests. Her parents are both the O positive blood type but her blood type is O negative. Out of all 8 blood types, only 6% of the population is O Neg, and transfusions can only come from compatible donors who are also the O Negative blood type.

Her mother is a 15 year employee of United Blood Services. Please assist the family in their efforts to increase the community blood supply, by donating at your upcoming blood drive in her honor. You can follow her progress on facebook at: <https://www.facebook.com/BabyPresleyJordan/>
